

## Offre n°2024-07262

# Post-Doctoral Research Visit F/M Control theory methods for epidemiological systems

Type de contrat : Fixed-term contract

Niveau de diplôme exigé : PhD or equivalent

Fonction : Post-Doctoral Research Visit

## A propos du centre ou de la direction fonctionnelle

The Inria University of Lille centre, created in 2008, employs 360 people including 305 scientists in 15 research teams. Recognised for its strong involvement in the socio-economic development of the Hauts-de-France region, the Inria University of Lille centre pursues a close relationship with large companies and SMEs. By promoting synergies between researchers and industrialists, Inria participates in the transfer of skills and expertise in digital technologies and provides access to the best European and international research for the benefit of innovation and companies, particularly in the region.

For more than 10 years, the Inria University of Lille centre has been located at the heart of Lille's university and scientific ecosystem, as well as at the heart of Frenchtech, with a technology showroom based on Avenue de Bretagne in Lille, on the EuraTechnologies site of economic excellence dedicated to information and communication technologies (ICT).

## Contexte et atouts du poste

### About the Inria center at the University of Lille

The Inria center at the University of Lille, created in 2008, is based on two sites: one on the University of Lille campus at La Haute-Borne and one in the midst of the EuraTechnologies entrepreneurial ecosystem.

The Inria center at the University of Lille has 15 project teams. Its activities occupy over 360 people, scientists and research and innovation support staff, including 38 different nationalities. Its scientific priority areas are data science, Software engineering, and cyber-physical systems.

### About the VALSE team

The VALSE team studies the problems arising in analyzing distributed, uncertain, and interconnected dynamical systems with the design of estimation and control algorithms using the concepts of finite-time/fixed-time/hyper exponential convergence and stability. The main idea is to separate and hierarchize, in time, space-distributed control, and estimation processes, greatly simplifying their analysis and the design for large-scale solutions.

For additional information on the VALSE team, please see <https://team.inria.fr/valse/>

This is a postdoc within the ANR project [NOCIME](#).

## Mission confiée

Emerging and re-emerging diseases are a continuous threat to our planet. This menace has grown over the last decades, leading to serious public health issues, significant mortality, and financial expenses, as the COVID-19 pandemic has shown. Various phenomena, such as urbanization and globalization, might explain this escalation.

Many mathematical models are already used to describe the transmission of an epidemic. However, the methods of automatic control theory are still not widespread in epidemiologic studies. The ANR NOCIME project aims to solve novel, broadly defined control theory problems connected to optimal control and the observation/identification of epidemiological dynamics, which demonstrate many challenging features.

In particular, fundamental properties of the system, namely identifiability, and observability, are generally required so that parameter estimation and observer design techniques can then be implemented, with a global guarantee of convergence on the domain, or guaranteed upper and lower estimates. Many epidemiological models exhibit several equilibria: all disease-free states are equilibrium points when births and deaths are neglected, which is appropriate at the outbreak time scale. These equilibria are often singular points of the identifiability and observability maps:

no information on the disease parameters and susceptible proportion can be inferred in the absence of infected individuals.

Assuming that observability (or identifiability) conditions and related sets are settled, the design of related estimators follows. Different types of observers will be developed, such as nonlinear or adaptive observers [1], [2] and interval observers [3], [4].

## Principales activités

The postdoctoral job will first study the observability and identifiability of several epidemiological models and develop specific (analytic and numerical) tools adapted for these kinds of nonlinear models. The question of observer synthesis will be addressed in a second step with different techniques. Finally, using observers with the control laws developed in the project (particularly optimal controls) will be a matter of investigation.

The young researcher will be expected to exchange with the NOCIME project's other partners based in Paris, Metz, and Montpellier.

## Compétences

### Skills and profile

- PhD in Mathematics or Applied Mathematics in Automatic Control
- A strong background in the observation and identification of dynamic systems
- A background in Matlab programming will be an advantage
- Interest in epidemiological questions

## Avantages

- Subsidized meals
- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Social security coverage

## Rémunération

2 788€ gross per month

## Informations générales

- Thème/Domaine : Optimization and control of dynamic systems
- Ville : Villeneuve d'Ascq
- Centre Inria : [Centre Inria de l'Université de Lille](#)
- Date de prise de fonction souhaitée : 2024-10-01
- Durée de contrat : 2 years
- Date limite pour postuler : 2024-06-30

## Contacts

## A propos d'Inria

Inria est l'institut national de recherche dédié aux sciences et technologies du numérique. Il emploie 2600 personnes. Ses 215 équipes-projets agiles, en général communes avec des partenaires académiques, impliquent plus de 3900 scientifiques pour relever les défis du numérique, souvent à l'interface d'autres disciplines. L'institut fait appel à de nombreux talents dans plus d'une quarantaine de métiers différents. 900 personnels d'appui à la recherche et à l'innovation contribuent à faire émerger et grandir des projets scientifiques ou entrepreneuriaux qui impactent le monde. Inria travaille avec de nombreuses entreprises et a accompagné la création de plus de 200 start-up. L'institut s'efforce ainsi de répondre aux enjeux de la transformation numérique de la science, de la société et de l'économie.

**Attention:** Les candidatures doivent être déposées en ligne sur le site Inria. Le traitement des candidatures adressées par d'autres canaux n'est pas garanti.

## Consignes pour postuler

CV + Cover Letter

### Sécurité défense :

Ce poste est susceptible d'être affecté dans une zone à régime restrictif (ZRR), telle que définie dans le décret n°2011-1425 relatif à la protection du potentiel scientifique et technique de la nation (PPST). L'autorisation d'accès à une zone est délivrée par le chef d'établissement, après avis ministériel favorable, tel que défini dans l'arrêté du 03 juillet 2012, relatif à la PPST. Un avis ministériel défavorable pour un poste affecté dans une ZRR aurait pour conséquence l'annulation du recrutement.

### Politique de recrutement :

Dans le cadre de sa politique diversité, tous les postes Inria sont accessibles aux personnes en situation de handicap.
