PhD Position F/M Decision models for the Edge-Cloud Computing Continuum

Type de contrat : Fixed-term contract

Niveau de diplôme exigé : Graduate degree or equivalent

Fonction : PhD Position

A propos du centre ou de la direction fonctionnelle

The Inria Centre at Rennes University is one of Inria's eight centres and has more than thirty research teams. The Inria Centre is a major and recognized player in the field of digital sciences. It is at the heart of a rich R&D and innovation ecosystem: highly innovative PMEs, large industrial groups, competitiveness clusters, research and higher education players, laboratories of excellence, technological research institute, etc.

Contexte et atouts du poste

Computing is shifting from the traditionally centralized cloud to a distributed set of heterogeneous resources located between the edge, the cloud and in-between. As computing has moved to this *Computing Continuum*, the tradeoffs between performance, availability and cost have become increasingly complicated.

This thesis aims at contributing to the programming support and the resource management of emerging infrastructures and applications. The rationale that underlies the proposed research is the separation between the concerns of domain experts (familiar with the applications) and these of resource managers (familiar with the computing infrastructures).

PhD Advisor: Daniel Balouek (Inria)

This thesis will be hosted by the STACK team at the IMT Atlantique of Nantes. This thesis will also include collaborations with industrial and international partners, especially from the US.

Mission confiée

Introduction

With the advent of distributed infrastructures, the Cloud computing paradigm is progressively moving towards a full continuum from IoT devices and sensors to the centralized Cloud, with Edge (edge of the network) and Fog computing (core network) in between [1]. Simultaneously, distributed applications also evolve. Urgent computing tackles services that require time-critical decisions that improve quality of life, monitor civil infrastructures, respond to natural disasters and extreme events, and accelerate science (e.g., autonomous cars, disaster response, precision medicine, etc.). These services are typically sensitive to latency and response time and are among the best candidate for the IoT to Cloud computing continuum [2].

In this thesis, we consider a new breed of urgent intelligent services using the IoT-to-Cloud Continuum, combined with the recent advances in Artificial Intelligence and Big Data Analytics. First, these services and applications require a large computing capacity to perform well, while often being under the constraints to move data from the edge of the network to the Cloud [3]. Second, these services and applications require system support to program reactions that occur at runtime, especially when the target infrastructure capacities and capabilities are unknown during the design [4].

Thesis Proposal

There is a critical gap in the knowledge base that pertains to programming urgent analytics while managing important trade-offs of cost and quality. The successful candidate will be in charge of proposing and evaluating decision models integrating the content of data, cost of computations, and urgency of the results for the management of applications deployed across edge and cloud resources.

Principales activités

The main challenge consists in proposing novel models for facilitating decision-making models for edge-to-cloud applications, and deducing management policies based on their impact. The research work can be decomposed into two main objectives:

- The first objective is to build and validate a set of models describing the dynamics of the computing continuum.
- The second objective is to augment the common operations of data-driven analytics (e.g. collection, filtering, processing, delivery) with tunable parameters.

Through these two objectives, the successful candidate is expected to propose approaches for building intelligent services that manage the availability and efficiency of the infrastructure. Building on analytical models and tunable software abstractions, this project will inform infrastructure managers and application developers with insights on what data and services to run, where to run them, and how to run them across the Computing Continuum.

We expect the successful candidate to create repeatable processes and artifacts that will be used at scale to develop and evolve edge computing designs. Experiments and validation will occur on Grid'5000, the biggest share network in Europe dedicated to research in Computer Science.

Compétences

- A Master degree in computer science or equivalent
- Solid background in Software Engineering and Distributed Systems
- Completion of a teaching unit in high-performance computing or distributed computing is an advantage
- Knowledge of edge computing, streaming systems or modeling approaches based on graphs or Petri Nets is an asset
- Programming skills in C/C++ and Python
- Good communication skills in oral and written English, with the aim to publish and present research results in high-level international journals and conferences
- Autonomous, curious and strongly motivated candidates are expected

Avantages

- Subsidized meals
- Partial reimbursement of public transport costs
- Possibility of teleworking (90 days per year) and flexible organization of working hours
- Partial payment of insurance costs

Rémunération

Monthly gross salary amounting to 2100 euros for the first and second years and 2190 euros for the third year

Informations générales

- **Thème/Domaine** : Distributed Systems and middleware System & Networks (BAP E)
- **Ville** : Nantes
- **Centre Inria** : [Centre Inria de l'Université de Rennes](#)
- **Date de prise de fonction souhaitée** : 2024-10-01
- **Durée de contrat** : 3 years
- **Date limite pour postuler** : 2024-05-24

A propos d'Inria

Inria est l'institut national de recherche dédié aux sciences et technologies du numérique. Il emploie 2600 personnes. Ses 215 équipes-projets agiles, en général communes avec des partenaires académiques, impliquent plus de 3900 scientifiques pour relever les défis du numérique, souvent à l'interface d'autres disciplines. L'institut fait appel à de nombreux talents dans plus d'une quarantaine de métiers différents. 900 personnels d'appui à la recherche et à l'innovation contribuent à faire émerger et grandir des projets scientifiques ou entrepreneuriaux qui impactent le monde. Inria travaille avec de nombreuses entreprises et a accompagné la création de plus de 200 start-up. L'institut s'efforce ainsi de répondre aux enjeux de la transformation numérique de la science, de la société et de l'économie.

Attention: Les candidatures doivent être déposées en ligne sur le site Inria. Le traitement des candidatures adressées par d'autres canaux n'est pas garanti.

Consignes pour postuler

Please submit online : your resume, cover letter and letters of recommendation eventually

Sécurité défense :

Ce poste est susceptible d'être affecté dans une zone à régime restrictif (ZRR), telle que définie dans le décret n°2011-1425 relatif à la protection du potentiel scientifique et technique de la nation (PPST). L'autorisation d'accès à une zone est délivrée par le chef d'établissement, après avis ministériel favorable, tel que défini dans l'arrêté du 03 juillet 2012, relatif à la PPST. Un avis ministériel défavorable pour un poste affecté dans une ZRR aurait pour conséquence l'annulation du recrutement.

Politique de recrutement :

Dans le cadre de sa politique diversité, tous les postes Inria sont accessibles aux personnes en situation de handicap.
