2017-00159 - Post-doctoral fellow. Modeling and simulation of cable transport systems

Level of qualifications required: PhD or equivalent
Fonction: Post-Doctoral Research Visit

About the research centre or Inria department
Grenoble Rhône-Alpes Research Center groups together a few less than 800 people in 35 research teams and 9 research support departments.

Staff is localized on 5 campuses in Grenoble and Lyon, in close collaboration with labs, research and higher education institutions in Grenoble and Lyon, but also with the economic players in these areas.

Present in the fields of software, high-performance computing, Internet of things, image and data, but also simulation in oceanography and biology, it participates at the best level of international scientific achievements and collaborations in both Europe and the rest of the world.

Context
This post-doc will be supervised by Vincent Acary (INRIA) and M. Weiss (STRMTG). Inria2 is the French National Institute for computer science and applied mathematics that promotes “scientific excellence for technology transfer and society”. The post-doc candidate will be welcome in the Bipop project team, a research team focused on the modeling and the simulation of nonsmooth dynamical systems. STRMTG4 is a national technical agency that is part of the French Environment, Energy and the Sea Ministry which is in charge of ropeway and guided transport safety.

Assignment
After a careful study of the literature, the objectives of the post-doc will be:

- to develop a numerical model of the dynamics a translating cable with moving suspended pendulums over two simple supports. In this step, the dynamics of terms of waves propagation (existence and stability) will be studied in details.

- to extend the previous step towards multiple supports that takes into account unilateral contact, impact and friction. The influence of the frictional contact boundary conditions will be studied in terms of tension in the rope and amplitude of the oscillations.

- to develop a model of sheaves with fixed pulleys and a moving cable with contact and friction and to study the passage of the grip of the vehicle into the sheaves. The effect of the nonsmooth behavior generated by the contact conditions over the dynamics of the cable will be detailed. – to improve the model of sheaves by considering the rigid multi-body system that links the pulleys.

Main activities
The final goal is to develop a numerical model and software code by extending the ability of Siconos1, in order to simulate cable transport systems with various levels of accuracy in the modeling.

Benefits package
- Subsidised catering service
- Partially-reimbursed public transport
- Social security
- Paid leave
- Flexible working hours
- Sports facilities

Remuneration
Gross salary / months: 2653 euros

General Information
- Theme/Domain: Optimization and control of dynamic systems
- Scientific computing (BAP E)
- Town/city: Montbonnot
- Inria Center: CRI Grenoble - Rhône-Alpes
- Starting date: 1/1/18
- Duration of contract: 1 year, 6 months
- Deadline to apply: 5/1/18

Contacts
- Inria Team: BIPOP
- Recruiter: Acary Vincent / vincent.acary@inria.fr

Conditions for application
Defence Security:
This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating to the protection of national scientific and technical potential (PPST). Authorisation to enter an area is granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated in a ZRR would result in the cancellation of the appointment.

Recruitment Policy:
As part of its diversity policy, all Inria positions are accessible to people with disabilities.

Warning: you must enter your e-mail address in order to save your application to Inria. Applications must be submitted online on the Inria website. Processing of applications sent from other channels is not guaranteed.
