2018-00304 - Comparison of time stepping methods for the Bloch-Torrey equation in diffusion MRI

Level of qualifications required: Master's or equivalent
Fonction: Internship Research

About the research centre or Inria department
Located at the heart of the main national research and higher education cluster, member of the Université Paris Saclay, a major actor in the French Investments for the Future Programme (Idex, LabEx, IRT, Equipex) and partner of the main establishments present on the plateau, the centre is particularly active in three major areas: data and knowledge; safety, security and reliability; modelling, simulation and optimisation (with priority given to energy).

The 450 researchers and engineers from Inria and its partners who work in the research centre's 31 teams, the 100 research support staff members, the high-level equipment at their disposal (image walls, high-performance computing clusters, sensor networks), and the privileged relationships with prestigious industrial partners, all make Inria Saclay Île-de-France a key research centre in the local landscape and one that is oriented towards Europe and the world.

Assignment
Diffusion Magnetic Resonance Imaging (dMRI) has been used extensively to image the brain and other organs such as the heart. The Bloch-Torrey Partial Differential Equation (PDE) governs the evolution of the water proton magnetization in a heterogeneous medium and can be used to model the dMRI signal in an imaging voxel.

Main activities
In this internship project, the student will use an existing Matlab code that solves the above equations with the finite element method (FEM) and compare several time stepping approaches for the resulting semi-discretized equations that are in the form of a large system of coupled ordinary differential equations (ODEs). There are several Matlab-implemented ODE solvers as well as the Runge-Kutta Chebyshev method to be compared. Numerical issues such as the stiffness of the resulting ODEs and rapid oscillations due to high gradient strength will need to be considered and evaluated for each of the ODE solvers.

Skills
This project requires the knowledge of basic partial differential equations (diffusion equation properties), numerical analysis (ODE solvers, numerical stiffness), and finite elements (constructing finite element matrices). Very importantly, it is necessary that the student can write good code in “Matlab” (correct and fast to run, i.e., using vector operations rather than loops, etc.).

Benefits package
- Subsidised catering service
- Partially-reimbursed public transport
- Social security
- Paid leave
- Flexible working hours
- Sports facilities

General Information
- Theme/Domain: Numerical schemes and simulations
- Scientific computing (BAP E)
- Town/city: PALAISEAU
- Inria Center: CRI Saclay - Île-de-France
- Starting date: 4/2/18
- Duration of contract: 4 months
- Deadline to apply: 3/31/18

Contacts
- Inria Team: DEFI
- Recruiter: Li Jing-rebecca / jing-rebecca.li@inria.fr

Conditions for application
Defence Security:
This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating to the protection of national scientific and technical potential (PPST). Authorisation to enter an area is granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated in a ZRR would result in the cancellation of the appointment.

Recruitment Policy:
As part of its diversity policy, all Inria positions are accessible to people with disabilities.

Warning: you must enter your e-mail address in order to save your application to Inria. Applications must be submitted online on the Inria website. Processing of applications sent from other channels is not guaranteed.
