2018-00527 - [Campagne CORDI-S-CRI Paris] High-level distributed computing

Contract type: Public service fixed-term contract
Level of qualifications required: Graduate degree or equivalent
Fonction: PhD Position

Context

Background

Distributed computing is relevant to developers in many different application areas, for instance, mobile computing, Internet of Things (IoT), high-performance computing, Network Function Virtualisation (NFV), neural networks, or internet gaming. However, distributed programming remains difficult and error-prone, exposing users, the economy, and critical infrastructure to bugs and security violations. Indeed, concurrency and failures, essential features of a distributed system, are difficult to abstract away, and interacting concurrent processes do not compose well. Furthermore, any large-scale distributed system suffers undetectable failures and cannot be strongly consistent, i.e., processes cannot reach consensus on a single up-to-date view of shared state; this is a fundamental result of distributed system theory (the FLP and CAP theorems).

Furthermore, there is a fundamental tension between the requirements of correctness (no execution bugs, no loss of data) and performance (with metrics that include availability, responsiveness and throughput). Correctness requires events to happen in a reliable, deterministic way. Performance requires concurrent, asynchronous execution. The “right” solution to this trade-off depends on application requirements, environment, workload, resources, etc. Getting this right is difficult.

Thus, non-expert programmers are required to navigate uncomfortable and weighty trade-offs in the presence of non-composable, non-deterministic, and weak consistency.

Assignment

Proposed research

This situation needs to be improved with a high-level approach. We seek a doctoral student to develop methods and tools to support the programmer of distributed services, and to apply them to the incremental development of a representative service such as a distributed storage service, or a distributed indexing service.

Highly successful and explicative abstractions already exist, such as (at opposite ends of the spectrum) consensus or data flow. Frameworks and languages are making distributed programming easily accessible in some restricted domains, for instance MapReduce, Spark or TensorFlow. Our team has been active in research to provide both high availability and correctness, e.g., developing high-level distributed data types (CRDTs), and efficient and correct protocols (NMSI, TCC). Our AntidoteDB database supports concurrent data types, including simple ones such as counters, flags, sets and maps, and more complex ones enforcing common invariants, such as uniqueness, bounded counter, referential integrity, and access control; multiple operations compose into atomic transactions. Our CISE tool verifies that the execution model of an application is sufficiently synchronised to guarantee the application’s safety invariants.

However, currently, the heavy lifting remains manual. We propose to develop programming methods and tools that allow the developer to create and compose abstractions while making use of the full power of concurrency and distribution.

1. Abstractions for data naming, sharing and storage (consistency and versioning), computation (processes), communication (invocation).
2. These abstractions can be instantiated and controlled by a separate control plane, enabling elastic configuration of the number and placement of computation and data entities, transparently to the program text.
3. A composition mechanism based on scoping enables information hiding.
4. Communication supports asynchronous (concurrent) and synchronous (consensus-based)

General Information

- Theme/Domain: Distributed Systems and middleware
  System & Networks (BAP E)
- Town/city: Paris
- Inria Center: CRI de Paris
- Starting date: 2018-10-01
- Duration of contract: 3 years
- Deadline to apply: 2018-04-23

Contacts

- Inria Team: DELYS
- Recruiter: Shapiro Marc / marc.shapiro@inria.fr

Conditions for application

Defence Security:
This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating to the protection of national scientific and technical potential (PPST). Authorisation to enter an area is granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated in a ZRR would result in the cancellation of the appointment.

Recruitment Policy:
As part of its diversity policy, all Inria positions are accessible to people with disabilities.

Warning: you must enter your e-mail address in order to save your application to Inria. Applications must be submitted online on the Inria website. Processing of applications sent from other channels is not guaranteed.
operation invocation, with transactional and causal consistency guarantees.
5. Communication channels are based on a publish-subscribe/data flow model, with forward
   and backward paths, and carry any mixture of state, delta, or operation.
6. Transparent storage and communication of metadata, such as timestamps, provenance,
   security labels, or accounting information.
7. Specifying preconditions, effects and invariants, in order to enable verification.

At the same time, our approach helps avoid many of the opportunities for error, by focusing on the
essential properties of application correctness. It is often the invariants required over application
data that dictates the protocol for accessing the data; this is an intuition that programmers
commonly apply. Hence, we aim to apply leverage language and verification tools, to aid the
programmer in choosing the best consistency level and in synthesising a program that respects its
specification.

Main activities
The research has both a fundamental and an applied aspect and aims for practical results.

Skills

Requirements and application
Candidates to this position should hold a Master's in Computer Science/Informatics or a related field.
They must be excited by research in systems, distributed systems, databases, and/or language and
verification, and should have an excellent academic record in one of these areas. He or she will be
developing and experimenting software at large scale. Teamwork and communication skills, industrial
experience, and good knowledge of Erlang and/or node.js is a plus. This is offered as part of Inria's
annual PhD competition. To apply, please provide the following information:

- A resume or Curriculum Vitæ.
- A list of courses and grades of the last two years of study (an informal transcript is OK).
- Names and contact details of at least two references (people who can recommend you),
  whom we will contact directly.
- If relevant, a link to your publications and/or open-source developments.

Benefits package
- Subsidised catering service
- Partially-reimbursed public transport

Remuneration
Gross Salary per month: 1 982 € the first 2 years and 2 085 € the last year
