A supervised statistical learning setting (regression model) will be defined since the scalar outcome characteristics (time-dependent data, large correlations between flight parameters, large scale data) optimization (OptiClimb), end to end IT solutions for airlines operations. Data recorder raw data decoding and processing, big data analytics to perform flight profile investigations, data scientists and IT specialists. SL aims to bring their capabilities ranging from flight solutions for aviation. With a team of highly experienced Safety experts (including former BEA Safety Line is an innovative digital technology company, specialized in data management software systems. Building on the synergies between research and industry, Inria is a major contributor to skills and technology transfer in the field of computer science.

Context:
Commercial aviation is already responsible of 3% of the total CO2 emissions, and with a constant growth rate of 5% per year, traffic will double within the next decade. Major improvements have been made in aircraft design and materials, engines performance and efficiency, still aircraft operations remain unchanged for many years. With the digital transformation of many industries, airline operations have been just at the beginning of a major change. With the support of new technologies related to machine learning and artificial intelligence, in-flight connectivity, major improvements can be introduced to optimize flight trajectories. The main objective of PERF-AI is to bring those new technologies to the field of aviation based on statistical analysis of flight data that are generated by aircraft throughout their lifecycle. Currently, aircraft manufacturers, flight management systems and flight preparation software providers are using a single manufacturer’s performance model that is the same for every aircraft of the same type, and also on a weather forecast that is computed long before the flight. The performance is based on manufacturer’s model that is derived from flight tests conducted on brand new aircraft during certification phase. The only corrections applied during these performances. The only corrections applied are made through the fuel or performance factor, that is a single percentage applied to the whole flight, though it is only a measurement made during cruise phase and corresponds to a steady flight. PERF-AI will focus on the challenge of minimizing fuel consumption throughout the flight. The aim will be to provide a flight trajectory optimization prototype that implements new machine learning performance models. Minimizing the fuel consumption can be mathematically modelled as an optimal control problem, whose solution is expected to be as close as possible to the best trajectory in reality. This can only be achieved if the mathematical modelling of the problem is performed as accurately as possible, a requirement for this being the precise estimation of the aircraft’s behaviour. This motivates the search for narrow system identification techniques, which are the main topic of this call. Several machine learning methods will be identified and tested for this purpose. New techniques will be proposed in order to have the most accurate tool as possible. Moreover, high-level artificial intelligence techniques will use the machine learning models for the objective of the fuel use minimization.

Assignment:
The postholder is expected to start in January 2019 or later. The position is funded for 18 months. The average gross monthly salary is about 2700€. The position comes with health insurance and social benefits, such as subsidised catering service and partially-reimbursed public transport. The project PERF-AI is funded by the European Commission for the period 2018-2020. The postholder will be working within the Modal project-team of the Inria Lille - Nord Europe research center, under the direct supervision of (i) Dr Benjamin Guedj, research scientist at Inria, (ii) Dr. Vincent Vandewalle, assistant Professor at Lille University. Inria is the top french research institute in computer science and mathematics, with a particular focus on machine learning and artificial intelligence. Inria is organized in eight research centers. Further info on Inria and its Lille - Nord Europe research center:

https://www.inria.fr/en/
https://www.inria.fr/en/centra/lille

Lille, France is a beautiful, historic city conveniently located near Paris, Brussels, and London with excellent train and air connections (50 minutes by high-speed train to CDG international airport), and is renowned for its welcoming living environment. Further info on Lille: https://en.wikipedia.org/wiki/Lille Occasional travels to Safety Line’s offices in downtown Paris are expected. Safety Line is an innovative digital technology company, specialized in data management software solutions for aviation. With a team of highly experienced Safety experts (including former BEA investigators), data scientists and IT specialists, SL aims to bring their capabilities ranging from flight data recorder raw data decoding and processing, big data analytics to perform flight profile optimization (OptiClimb), end to end IT solutions for airlines operations. https://www.safety-line.fr

Main activities:
The postdoc will define the mathematical problem from the technical challenges and the flight data characteristics (time-dependent data, large correlations between flight parameters, large scale data) in a general setting. A supervised statistical learning setting (regression model) will be defined since the scalar outcome

General Information:
- Theme/Domain: Optimization, machine learning and statistical methods
- Statistics (Big data) (BAP E)
- Town/city: Villeneuve d’Ascq
- Inria Center: CRI Lille - Nord Europe
- Starting date: 2019-01-01
- Duration of contract: 1 year, 6 months
- Deadline to apply: 2018-12-31

Contacts:
- Inria Team: MODAL
- Recruiter: Guedj Benjamin / benjamin.guedj@inria.fr

About Inria:
Inria, the French national research institute for the digital sciences, promotes scientific excellence and technology transfer to maximise its impact. It employs 2,400 people. Its 200 agile project teams, generally with academic partners, involve more than 3,000 scientists in meeting the challenges of computer science and mathematics, often at the interface of other disciplines. Inria works with many companies and has assisted in the creation of over 200 startups. It strives to meet the challenges of the digital transformation of science, society and the economy.

Conditions for application:
Full applications will be processed in priority (CV + Cover letter + 2 letters of recommendation).

Defence Security:
This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating to the protection of national scientific and technical potential (PPST). Authorisation to enter an area is granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated in a ZRR would result in the cancellation of the appointment.

Recruitment Policy:
As part of its diversity policy, all Inria positions are accessible to people with disabilities.

Warning: you must enter your e-mail address in order to save your application to Inria. Applications must be submitted online on the Inria website. Processing of applications sent from other channels is not guaranteed.
The postdoc will identify relevant state-of-the-art machine learning algorithms. It includes, but not limited to, tree-based ensemble algorithms and Gradient Boosting algorithms, model aggregation, Bayesian and kernel methods. Safety Line will bring an expertise to the flight data and flight mechanics that will support the statistical modelling.

A particular focus will be on the development of an optimization procedure which makes use of the aircraft performance model defined. A reinforcement learning setting with continuous states and actions will be investigated in order to take into account nonparametric performance models. The optimization tools will be adapted to all flight phases (climb, cruise, descent) and a first proof of concept will be implemented.

Skills
- PhD degree in statistics, machine learning, or related area.
- Working fluency in English. French is also helpful but not required, as international research in the area is typically published and presented in English.
- Ability to take leadership roles on research projects, and also to engage in cooperative teamwork.
- Ability to write research papers and diffuse results in international conferences.
- Good Python programming skills for running experiments with developed algorithms.

Benefits package
- Subsidised catering service
- Partially-reimbursed public transport
- Social security
- Paid leave

Remuneration
Gross salary 2653 € per month.
