Offer #2023-06731

PhD Position F/M Aerial Robots with the sense of touch

Contract type: Fixed-term contract

Level of qualifications required: Graduate degree or equivalent

Fonction: PhD Position

About the research centre or Inria department

The Inria Centre at Rennes University is one of Inria's eight centres and has more than thirty research teams. The Inria Centre is a major and recognized player in the field of digital sciences. It is at the heart of a rich R&D and innovation ecosystem: highly innovative PMEs, large industrial groups, competitiveness clusters, research and higher education players, laboratories of excellence, technological research institute, etc.

Context

Conditions:

- The work will be carried in English in the Rainbow team at the Inria Rennes Bretagne Atlantique research center.
- The Ph.D. position is full-time for 3 years (standard duration in France). The position will be paid according to the French salary regulations for PhD students.
- We do high quality and impactful research in robotics, publishing on the major journals and conferences.
- We often collaborate with other top researchers in Europe and worldwide.
- You will have access to a well established laboratory including:
  - two flying arenas equipped with motion tracking system, several quadrotors, and a few fully-actuated manipulators,
  - one robotic manipulation lab equipped with several robotic arms, like the Franka Emika Panda.
- You will be part of an international and friendly team. We organize several events, from after works, to multi-day lab retreat.
- Regular visits and talks by internationally known researchers from top research labs.

Supervisors: M. Tognon, P. Robuffo Giordano

Assignment

Short Abstract: Researchers are trying to make aerial robots perform physical work. Current methodologies show promising results, but they fail in real scenarios, mostly because of inaccurate visual perception. Inspired by nature, this project investigates how to also provide aerial robots with the sense of touch and how to use it for improving their manipulation capabilities.

Description: Aerial robots (commonly called “drones”) are nowadays extensively used to perceive the environment for surveillance and monitoring in applications like agriculture, mapping, etc. But if aerial robots were also able to effectively manipulate the environment, the application domains could be further extended toward new areas like contact-based inspection, assembly and construction, and so on. But contact is today synonymous for crash, and thus avoided. The unstable nature of aerial robots, their non-linear dynamics, and limited vision-based perception, make the manipulation problem in real environments extremely difficult and delicate.

To show the feasibility of Aerial Physical Interaction (APhI), the research community has previously focused on the design and control of aerial manipulators [1]. This opened the door to new applications, e.g., contact-based inspection [2,3]. However, current methodologies are still limited to very simple interaction tasks, involving limited contact behaviors with static and rigid surfaces (e.g., touching a flat wall with a stick rigidly attached to the robot [4]).

Inspired by nature, we want to tackle the problem by considering a novel aspect: the sense of touch. We
hypothesize that the sense of touch (as for humans) can give a new improved understanding of the environment and the physical interaction between the aerial robot and its surrounding. In AEROTouch, we aim at giving the missing sense of touch to aerial robots and design new haptic-based control methods that would make these robots eventually capable of performing real physical work in real environments.

Main activities

Envisaged Activities:

So far, to the best of our knowledge, no one has attempted to extend touch capabilities to aerial robots, and even less to exploit tactile sensors as direct feedback to perform manipulation. We will address these challenges in the following points:

- **Tactile sensor**: On one side we have to answer the question if and which tactile sensors are feasible for flying robots. We will review and evaluate different tactile sensors mounted on the end-effector of an aerial manipulator (e.g., Digit from Meta, and uSkin from Xela).
- **Haptic-based control**: On the other side, we have to understand how to use those measurements at best. We will take inspiration from visual-servoing and reinforcement-learning control methods to define a new haptic-servoing paradigm, where the robot actions are defined to reproduced a desired haptic feeling, e.g., the one to open a door.
- **Experimental evaluation**: The proposed methodologies will be validated on real aerial manipulators. Their effectiveness will be demonstrated through complex interaction tasks in real-world scenarios, like opening a door with only onboard sensors (both visual and haptic) and minimal knowledge of the environment.

Benefits package

- Subsidized meals
- Partial reimbursement of public transport costs
- Possibility of teleworking (90 days per year) and flexible organization of working hours
- Partial payment of insurance costs

Remuneration

Monthly gross salary amounting to 2082 euros for the first and second years and 2190 euros for the third year

General Information

- **Theme/Domain**: Robotics and Smart environments
- **Town/city**: Rennes
- **Inria Center**: Centre Inria de l'Université de Rennes
- **Starting date**: 2024-09-01
- **Duration of contract**: 3 years
- **Deadline to apply**: 2024-10-31

Contacts

- **Inria Team**: RAINBOW
- **PhD Supervisor**: Tognon Marco / marco.tognon@inria.fr

About Inria

Inria is the French national research institute dedicated to digital science and technology. It employs 2,600 people. Its 200 agile project teams, generally run jointly with academic partners, include more
than 3,500 scientists and engineers working to meet the challenges of digital technology, often at the
interface with other disciplines. The Institute also employs numerous talents in over forty different
professions. 900 research support staff contribute to the preparation and development of scientific and
entrepreneurial projects that have a worldwide impact.

The keys to success

Requirements:

- M.Sc. degree in mechatronics, robotics, engineering, computer science (or related fields)
- Excellent written and spoken English skills
- Good experience in C/C++, ROS, Matlab/Simulink, CAD
- Good experience with numerical trajectory optimization tools for robotics (e.g., use of CaSaDi,
  Acado, Autodiff, Crocoddyl, etc.)
- Scientific curiosity, large autonomy and ability to work independently
- Experience with visual sensors and visual perception for robotics is a plus
- Experience with robotic systems and/or aerial robots is a plus

Warning: you must enter your e-mail address in order to save your application to Inria. Applications
must be submitted online on the Inria website. Processing of applications sent from other channels is
not guaranteed.

Instruction to apply

Please submit online: your resume, cover letter and letters of recommendation eventually

Defence Security:
This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating
to the protection of national scientific and technical potential (PPST). Authorisation to enter an area is
granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree
of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated
in a ZRR would result in the cancellation of the appointment.

Recruitment Policy:
As part of its diversity policy, all Inria positions are accessible to people with disabilities.
