

Offer #2025-09089

PhD Position F/M Personalized Modeling and Control of the Eye-Head-Neck System in Myopic Children

Contract type: Fixed-term contract

Level of qualifications required: Graduate degree or equivalent

Fonction: PhD Position

Context

Context

The MIMESIS team at INRIA is a leading research group at the crossroads of scientific computing, machine learning, medical imaging, and control. Our mission is to develop cutting-edge digital tools for personalized medicine, particularly through the creation of **digital twins** and advanced **numerical methods** to assist medical interventions. With a strong foundation in **biomechanical modeling of soft tissues** and real-time computational methods, we work closely with clinicians to translate scientific innovations into practical healthcare solutions — from surgical planning to augmented reality and robotic control.

As part of this commitment, the MIMESIS team is now involved in **PREMYOM**, a large-scale, five-year biomedical innovation project focused on **personalized myopia treatment for children**. Coordinated by **EssilorLuxottica** and funded by the **France 2030** national plan, the PREMYOM consortium brings together six prestigious French partners from research, industry, and healthcare: **INRIA**, **Hôpital Fondation Adolphe de Rothschild**, **Institut de la Vision**, **Institut Mines-Télécom**, and **InSimo**.

PREMYOM aims to establish a new standard in pediatric eye care by developing predictive models and digital tools that account for the anatomical, optical, and behavioral factors influencing myopia progression. The project's ambitious goal is to transform how we understand, monitor, and treat myopia—turning personalized vision care into a reality.

Assignment

Your mission will be to contribute to the development of advanced anatomical and biomechanical models of the human eye and its interaction with the head and neck, as part of the broader goal of improving personalized care for children affected by myopia. These models will form the foundation of a digital twin framework designed to support diagnosis, treatment planning, and the development of custom therapeutic lenses.

You will focus on the study and development of biomechanical models for the eye-head-neck system. First, these models will serve to simulate ocular and postural behavior of children engaged in various visual tasks, offering insights into how head and eye movements may influence optical performance and the progression of myopia. Achieving this will necessitate the implementation of biomechanical control laws capable of handling the highly redundant and geometrically intricate eye-head-neck system in a physically plausible manner, while simultaneously accounting for myopia-induced anatomical and behavioral changes. Second, these models will also serve to evaluate the optical and ergonomic effects of different lens designs during real-life activities, providing essential data to optimize the fit, comfort, and efficacy of therapeutic eyewear. Indeed, maximal lens wear-time will likely enhance the potential for therapeutic success, and thus, minimal visual fatigue during daily visual tasks will have to be optimized for. Your work, towards such optimization objective, will require the study and development of muscle fatigue models adapted to myopic eye-headneck systems.

This work support the generation of individualized eye models that could guide the design of personalized myopia control lenses, based on a combination of anatomical, biomechanical, and behavioral inputs. These models will be integrated into an e-health decision-support tool, facilitating real-world application of research outcomes in clinical and commercial settings.

Skills

We are looking for a motivated and skilled candidate with the following qualifications:

Required:

- MSc or PhD in biomedical engineering, applied mathematics, computer science, or a related field.
- Strong background in the **finite element method** and **biomechanical simulation**.
- Strong background with **numerical analysis** and **optimization techniques**.
- Proficiency in **scientific programming** (e.g., Python, C++).
- Communication skills for team working.

Desirable:

- Knowledge of the **eye-head-neck system** and its biomechanics.
- Knowledge of machine learning techniques.
- Experience in collaborative research or interdisciplinary healthcare projects.

Benefits package

• Subsidized meals

- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking (after 6 months of employment) and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Social security coverage

Remuneration

2200 € gross/month

General Information

• Theme/Domain : Computational Neuroscience and Medicine Biologie et santé, Sciences de la vie et de la terre (BAP A)

• **Town/city**: Strasbourg (near the hospital campus)

• Inria Center : Centre Inria de l'Université de Lorraine

Starting date: 2025-10-01
Duration of contract: 3 years
Deadline to apply: 2025-08-01

Contacts

• Inria Team : MIMESIS

• PhD Supervisor:

Cotin Stephane / Stephane.Cotin@inria.fr

About Inria

Inria is the French national research institute dedicated to digital science and technology. It employs 2,600 people. Its 200 agile project teams, generally run jointly with academic partners, include more than 3,500 scientists and engineers working to meet the challenges of digital technology, often at the interface with other disciplines. The Institute also employs numerous talents in over forty different professions. 900 research support staff contribute to the preparation and development of scientific and entrepreneurial projects that have a worldwide impact.

Warning: you must enter your e-mail address in order to save your application to Inria. Applications must be submitted online on the Inria website. Processing of applications sent from other channels is not guaranteed.

Instruction to apply

Defence Security:

This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating to the protection of national scientific and technical potential (PPST). Authorisation to enter an area is granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated in a ZRR would result in the cancellation of the appointment.

Recruitment Policy:

As part of its diversity policy, all Inria positions are accessible to people with disabilities.
