A propos du centre ou de la direction fonctionnelle

The Inria Lille - Nord Europe Research Centre was founded in 2008 and employs a staff of 360, including 300 scientists working in sixteen research teams. Recognised for its outstanding contribution to the socio-economic development of the Hauts-De-France region, the Inria Lille - Nord Europe Research Centre undertakes research in the field of computer science in collaboration with a range of academic, institutional and industrial partners.

The strategy of the Centre is to develop an internationally renowned centre of excellence with a significant impact on the City of Lille and its surrounding area. It works to achieve this by pursuing a range of ambitious research projects in such fields of computer science as the intelligence of data and adaptive software systems. Building on the synergies between research and industry, Inria is a major contributor to skills and technology transfer in the field of computer science.

Contexte et atouts du poste

Debuggers are applications that users use to debug other applications. Lots of tools provide users with a large variety of debugging capabilities. However several aspects of the debugging activity are poorly covered by scientific and technical state-of-the-art. For example, it is still very hard to debug concurrent or parallel systems.

It is also not very clear how to implement advanced debugging tools such as back-in-time debuggers, or what support a run-time infrastructure (e.g., a virtual machine) provide for advanced debugging.

Finally, often tools are inflexible and cannot be adapted to specific domain or projects. New generation tools should not only support the developers customising tools to their own workflow and domain, but also be dynamically activated even if the virtual machine does not support them. Therefore, virtual machines should also be extendable with new, user-defined primitives and support for debugging.

Results will be submitted to international conferences and journals and an effort will be put to produce systems that can be used by (normal) developers so that user experiences provide real data.

The work will happen in collaboration between Inria Lille (RMOD team) and Vrije Universitat Brussels (SOFT lab).

RMOD

The goal of RMOD is to support remodularization and development of modular object-oriented applications. We tackle this objective from two complementary perspectives: reengineering, and constructs for dynamic languages. In the context of languages, we revisit language concepts such as modules and composition; we are also working on a new generation of reflective systems. We experiment with these programming constructs using Pharo, an open source, reflective, object-oriented language. http://rmod.inria.fr

Mission confiée

Objectives

The goal of this Postdoc is to build new advanced debuggers to explore and experiment one or more of the following topics:

- Back-in-time and scriptable debuggers
  - How to build back-in-time debuggers?
  - What abstractions do we need to take advantage of back-in-time debuggers? (scripting, DSLs...)
  - How can users extend, customise and enhance their debugger? (following PhD of A. Chis on Moldable Tools and the work of T. Dupriez on scriptable debuggers)

- Extendable virtual machines for advanced debugging support
  - What primitives do we need from the virtual machine to support advanced debugging tools? (back-in-time debuggers, object-centric debuggers, etc.)
  - How can users create new debugging primitives and enable them on-demand when a particular bug happens and requires investigation without restarting the program?

- Advanced debuggers for concurrency
  - How can we track specific objects in a concurrent execution and how this capability helps in debugging concurrent programs? (following the PhD of S. Costiou on unanticipated object-centric debugging)
  - What are and how to express object-centric debugging queries on the flow of objects, shared by concurrent processes?
  - Can we leverage Dynamic Software Update techniques to safely instrument running

Informations générales

- Thème/Domaine : Programmation distribuée et génie logiciel
- Ville : Villeneuve d'Ascq
- Centre Inria : Centre Inria Lille - Nord Europe
- Date de prise de fonction souhaitée : 2020-02-01
- Durée de contrat : 1 an, 6 mois
- Date limite pour postuler : 2020-01-31

Contacts

- Equipe Inria : RMOD
- Recruteur : Costiou Steven / steven.costiou@inria.fr

A propos d'Inria

Inria, l'institut national de recherche dédié aux sciences du numérique, promeut l'excellence scientifique et le transfert pour avoir le plus grand impact. Il emploie 2400 personnes. Ses 200 équipes-projets agiles, en général communes avec des partenaires académiques, impliquent plus de 3000 scientifiques pour relever les défis des sciences informatiques et mathématiques, souvent à l'interface d'autres disciplines. Inria travaille avec de nombreuses entreprises et a accompagné la création de plus de 160 start-up. L'institut s'efforce ainsi de répondre aux enjeux de la transformation numérique de la science, de la société et de l'économie.

Consignes pour postuler

CV, application letter, list of publications, one or more letters of recommendation and a short research statement.

Sécurité défense

Ce poste est susceptible d'être affecté dans une zone à régime restrictif (ZRR), telle que définie dans le décret n°2011-1425 relatif à la protection du potentiel scientifique et technique de la nation (PPST). L'autorisation d'accès à une zone est délivrée par le chef d'établissement, après avis ministériel favorable, tel que défini dans l'arrêté du 03 juillet 2012, relatif à la PPST. Un avis ministériel défavorable pour un poste affecté dans une ZRR aurait pour conséquence l'annulation du recrutement.

Politique de recrutement

Dans le cadre de sa politique diversité, tous les postes Inria sont accessibles aux personnes en situation de handicap.

Attention : Les candidatures doivent être déposées en ligne sur le site Inria.
Le traitement des candidatures adressées par d'autres canaux n'est pas garanti.
concurrent programs with advanced debugging instrumentation? (following the PhD of P. Tesone on DSU for live and production environments)

Support for debugging tools

- Can we use type inferencers to ease the design of debugging tools and limit their impact on performance and memory on dynamic languages runtimes? (following work on RoelTyper and PhD of L. Spoon on type inference)

Principales activités

The plan is to:

- Join the team work around debugging, that includes 3 researchers and 1 phd student
- Survey the key developer activities
- Define new model and enhance current
- Realize prototypes, possibly using Pharo
- Run validation with real end-users
- Publish results in top venues

Compétences

Technical skills and level required

- OOP, TDD
- Reflective programming
- Program transformation

Language

- English

Relational skills

- Good team work skills

Other valued appreciated

- Knowledge of the Pharo language is a plus
- A strong interest about debugging and/or dynamic languages is also appreciated

Avantages

- Subsidized meals
- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking (after 6 months of employment) and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training

Rémunération

Gross monthly salary (before taxes) : 2 653 €
