2023-06249 - Post-Doctoral Research Visit F/M
Primal-Dual relaxations for Non-Linear Problems

Type of contract : CDD
Contrat renouvelable : Oui
Niveau de diplôme exigé : Thèse ou équivalent
Function : Post-Doctorant
Niveau d’expérience souhaité : De 3 à 5 ans

A propos du centre ou de la direction fonctionnelle

The AROMA team at Université Côte d’Azur includes 37 research teams and 8 support services. The centre’s staff (about 500 people) is made up of scientists of different nationalities, engineers, technicians and administrative staff. The teams are mainly located on the university campuses of Sophia Antipolis and Nice as well as Montpellier, in close collaboration with research and higher education laboratories and establishments (Université Côte d’Azur, CNRS, INRAE, INSERM, ...), but also with the regional economic players.

With a presence in the fields of computational neuroscience and biology, data science and modeling, software engineering and certification, as well as collaborative robotics, the AROMA team at Université Côte d’Azur is a major player in terms of scientific excellence through its results and collaborations at both European and international levels.

Contexte et atouts du poste

Team AROMA (https://team.inria.fr/aromath/), inria at Université Côte d’Azur, team leader Bernard Mourrain.

Research topics: computational algebraic geometry, efficient algorithms for solving the non-linear problems, exploiting algebraic structures, stable against numerical perturbation, high order geometric modeling exploiting algebraic representations, for the accurate description of shapes.

Contact: Bernard Mourrain (http://www-sop.inria.fr/members/Bernard.Mourrain/)
Beside carrying out high quality research, we expect the postdoc to participate to the activities of the EU network TENORS on tensors and optimisation, which will start in January 2024.

The postdoc will also have the opportunity to collaborate with PhD students working on related topics.

Mission confiée

Non-Linear Equations are ubiquitous in domains such as geometric modelling, scientific computing, data analysis, … Finding their solutions is an instance of non-linear optimisation problems. A classical approach to tackle these non-linear problems is to use local methods, such as Newton method or gradient descent methods. This family of methods is widely used in practice, but it only provides local extrema with no guaranty for a global solution. Moreover, it is very sensitive to the choice of the initial point. Alternative algebraic approaches such as Gröbner basis have been developed over the last decades to compute all the solutions of polynomial equations [2]. They involve direct computations with the polynomial equations, but are not numerically stable. Border basis [6], which have been developed more recently for robustness purposes, also involves primal polynomial computations.
At the turn of this century, an innovative approach has been proposed by J.B. Lasserre, to approximate global optima [4]. It involves primal convex cones of sums of squares of polynomials and their dual cones of pseudo-moment sequences. The core of the approach is to approximate positive polynomials by sums of squares and moments of measures by positive pseudo-moment sequences. These primal-dual relaxations allow to recover the optimal value and all the solutions of the optimization problem.

The objective of the project is to explore new types of primal-dual relaxations, which lead to efficient methods for solving global non-linear problems.

The first part of the project will be dedicated to the study of non-linear problems with a finite number of solutions, based on linear primal and dual relaxations. We will investigate new methods extending the Truncated Normal Form (TNF) approach [5] for solving non-linear constraints.

In a second part, we will consider non-linear optimisation problems defined on general basic semi-algebraic sets. We will investigate new primal and dual convex relaxations for other types of functions such as splines, polynomial exponential functions [3], or network functions used in Machine Learning for data fitting. We aim at analysing the capacity of approximation of these relaxations [1], their potential to recover the optimal value and all the solutions of the optimization problem.

A propos d’Inria

Inria is the national institute of research dedicated to the sciences and technologies of the digital. It employs 2600 people. Its 200 agile and general-purpose teams, in close collaboration with other academic and industrial partners, employ more than 3500 scientific personnel. It is a major player in the innovation and digital sectors, often at the interface of various disciplines. It is also committed to the creation of a new era of digital innovation, and to the development of new technologies. Inria works with more than 180 companies and partners, and plays a key role in the meeting of the digital world and the world of industry. It is also a major player in terms of scientific excellence through its results and collaborations at both European and international levels.

L’essentiel pour réussir

Candidates must hold a PhD in Mathematics or Computer Sciences. Candidates must also show evidence of research productivity (e.g. papers, conference presentations, etc.) at the highest level.

We prefer candidates who have strong mathematical background (on computer algebra, optimisation or scientific computing) and in general are keen on using mathematics to model real problems and get insights. The candidate should also be knowledgeable on software development and have good programming skills. Previous experiences with Julia is a plus.

The position is for 12 months, renewable for one more year, for a total of 24 months.

Attention : Les candidatures doivent être déposées en ligne sur le site Inria.
Principales activités

The research activity will follow a classical path: literature review, exchange, brainstorming, development of new results... Software development (for instance with Julia Language) and experimentation can be considered to validate new methods. The collaboration will be conducted through regular meetings with the advisors. The post-doctoral fellow will have the opportunity to bring his/her own expertise and will be encouraged to open up his/her own research avenues. He/she will benefit from the rich environment and expertise in effective algebraic geometry and computer algebra at the AROMATH team and at the University Côte d’Azur, from seminars and workshops and from our network of collaborators.

Compétences

The following skills are desired for this position:

- a strong research background in the domain of the project (or at least in a specific area such as computer algebra, geometry, optimization or scientific computing)
- good communication and reporting skills, and an interest in collaborative work
- proficiency in English

Avantages

- Subsidized meals
- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Contribution to mutual insurance (subject to conditions)

Rémunération

Gross Salary: 2746 € per month
