

Offre n°2024-07376

Post-Doctoral Research Visit F/M Efficient Deep Learning (IDP 2024)

Le descriptif de l'offre ci-dessous est en Anglais

Type de contrat :CDD

Niveau de diplôme exigé :Thèse ou équivalent

Autre diplôme apprécié :PhD degree in Computer Science/ Mathematics/ Machine Learning/other technical field

Fonction :Post-Doctorant

Contexte et atouts du poste

Objective

Optimise the training and inference of modern neural networks to create large-scale AI models for science. Develop theoretical approaches and corresponding software.

Work environment

You will be a part of [Topal](#) INRIA team in Bordeaux, which includes experts in both HPC and AI fields.

Particularly, for the last several years members of the Topal team have been working on optimizing the training of neural networks by applying techniques from high performance computing, linear and tensor algebra (please, see papers from [ICML'23](#), [ICML'23](#), [IJCAI'22](#), [NeurIPS'21](#) and workshop [WANT@NeurIPS'23](#)). You will work closely with [Julia Gusak](#), [Lionel Eyraud-Dubois](#), and [Olivier Beaumont](#).

Is regular travel foreseen for this post?

Short-term visits to conferences and collaborative laboratories. In particular, the team is involved with a tight collaboration with Caltech within the framework of Associated Team ELF.

Mission confiée

Scientific Research context:

The unprecedented availability of data, computation, and algorithms has enabled a new era in AI, as evidenced by breakthroughs like Transformers and LLMs, diffusion models, etc., leading to groundbreaking applications such as ChatGPT, generative AI, and AI for scientific research. However, all these applications share a common challenge: they keep getting bigger, which makes training models harder. This can be a bottleneck for the advancement of science, both at industry scale and for smaller research teams that may not have access to very large training infrastructure. While there already exists a series of effective techniques (e.g., see the overview [2]), recent ones either still rely on manual hyperparameter settings or lack automatic joint optimization of orthogonal approaches (e.g., pipelining and advanced re-materialization).

Work description:

Concerning the training phase, one group of methods proposes advanced parallelization techniques, such as model and pipelined parallelism, for which the members of Topal already contributed [1, 3, 4]. They are used to split models across devices. Another group of methods considers effective optimizers. For example, ZeRO optimizer proposes optimizer state/gradients partitioning to reduce memory footprint during the optimization step. Additionally, to reduce the required per-GPU memory allocation, offloading and checkpointing (or re-materialization) techniques can be used. Offloading to CPU saves memory at the price of an overhead on communications, while activation checkpointing recomputes parts of the computational graph when applied, thus saving memory at the price of an overhead on computations. All types of techniques can be combined to achieve better throughput. Recent papers consider a combination of pipeline parallelism with activation checkpointing techniques [5, 6].

An important point is that algorithms with theoretically better time/memory complexity in practice might provide fewer benefits as it could be expected from analytical derivations. The reason is the

overhead caused by specific hardware we use to train or execute neural networks. To make deep learning algorithms efficient in real life it is important to combine software and hardware optimization when creating new deep learning algorithms.

During the Postdoc contract we plan to propose novel approaches to improve efficiency (memory/time/communication costs) of neural network training and inference. Particularly, by finding best model execution schedule which allows using different types of techniques, including but not limited to parallelisms, re-materialization, offloading, low-bit computations. Along with theoretical contribution to the field, there will be developed software to automatically optimize the training and inference of modern deep learning architectures.

Potential applications will include, but not be limited to, computer vision, natural language processing, climate, etc.

Principales activités

Activities:

- Implement different techniques for efficient multi-GPU training and inference.
- Propose new approaches for efficient deep learning (based on pipelining, checkpointing, offloading, and other optimization techniques).
- Develop software to automatically optimise the training and inference of modern deep learning architectures.
- Perform experiments with modern neural networks, including GPT-like models and Neural Operators. Potential applications will include, but not be limited to, computer vision, natural language processing, climate, etc.
- Analyze the performance of models using profiling tools.
- Write scientific papers
- Collaborate with [Topal](#) colleagues in Europe and US

Compétences

Technical skills and level required

- Good knowledge in Machine Learning and Deep Learning
- Basic knowledge in Linear algebra, Optimization, Probability Theory, Calculus
- Experience with Python, PyTorch, LaTeX, Linux, Git (will be a plus: Docker, Singularity, Slurm)
- Publications at A/A* conferences in Machine Learning will be a plus.

Languages: English

Avantages

- Subsidized meals
- Partial reimbursement of public transport costs
- Possibility of teleworking and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Social security coverage

Rémunération

2788€ / month (before taxes)

Informations générales

- Thème/Domaine : Optimisation, apprentissage et méthodes statistiques

- Calcul Scientifique (BAP E)
- Ville : Talence
 - Centre Inria : [Centre Inria de l'université de Bordeaux](#)
 - Date de prise de fonction souhaitée : 2024-10-01
 - Durée de contrat : 2 ans
 - Date limite pour postuler : 2024-05-03

Contacts

- Équipe Inria : [TOPAL](#)

Beaumont Olivier / Olivier.Beaumont@inria.fr

A propos d'Inria

Inria est l'institut national de recherche dédié aux sciences et technologies du numérique. Il emploie 2600 personnes. Ses 215 équipes-projets agiles, en général communes avec des partenaires académiques, impliquent plus de 3900 scientifiques pour relever les défis du numérique, souvent à l'interface d'autres disciplines. L'institut fait appel à de nombreux talents dans plus d'une quarantaine de métiers différents. 900 personnels d'appui à la recherche et à l'innovation contribuent à faire émerger et grandir des projets scientifiques ou entrepreneuriaux qui impactent le monde. Inria travaille avec de nombreuses entreprises et a accompagné la création de plus de 200 start-up. L'institut s'efforce ainsi de répondre aux enjeux de la transformation numérique de la science, de la société et de l'économie.

L'essentiel pour réussir

Passionate about AI and HPC, taste for the design of algorithm, their implementation, and experimental validation.

Attention: Les candidatures doivent être déposées en ligne sur le site Inria. Le traitement des candidatures adressées par d'autres canaux n'est pas garanti.

Consignes pour postuler

Thank you to send:

- CV
- Cover letter
- Support letters (mandatory)
- List of publication

Sécurité défense :

Ce poste est susceptible d'être affecté dans une zone à régime restrictif (ZRR), telle que définie dans le décret n°2011-1425 relatif à la protection du potentiel scientifique et technique de la nation (PPST). L'autorisation d'accès à une zone est délivrée par le chef d'établissement, après avis ministériel favorable, tel que défini dans l'arrêté du 03 juillet 2012, relatif à la PPST. Un avis ministériel défavorable pour un poste affecté dans une ZRR aurait pour conséquence l'annulation du recrutement.

Politique de recrutement :

Dans le cadre de sa politique diversité, tous les postes Inria sont accessibles aux personnes en situation de handicap.
