Offre n°2024-07877

Energy consumption management and optimization in a high performance cardiac electrophysiology application

Le descriptif de l’offre ci-dessous est en Anglais

Type de contrat : CDD

Niveau de diplôme exigé : Bac + 5 ou équivalent

Fonction : Ingénieur scientifique contractuel

Niveau d'expérience souhaité : De 3 à 5 ans

A propos du centre ou de la direction fonctionnelle

The Inria center at the University of Bordeaux is one of the nine Inria centers in France and has about twenty research teams. The Inria centre is a major and recognized player in the field of digital sciences. It is at the heart of a rich R&D and innovation ecosystem: highly innovative SMEs, large industrial groups, competitiveness clusters, research and higher education players, laboratories of excellence, technological research institute...

Contexte et atouts du poste

Context

Electricity is a cornerstone of life. Neurons generate electric currents across their cell membrane to transport signals, skeletal muscle cells do so to trigger their contraction, and cardiac muscle cells do both, synchronizing electrically to coordinate contraction across the heart muscle. Malfunctions in cellular electrical systems can have disastrous effects on the organism. Electrical disorders are responsible for half of all cardiac diseases, the most frequent cause of death in the world.

Cellular electric activity is generated by the interaction of many different proteins that are embedded in the cell membrane. Numerical models are vital to understand these complex systems. Yet, realistic simulations of cardiac electrophysiology in structurally abnormal tissue require discretization of the individual cells and their interconnections. This means at least a factor 10^5 increase in model size compared to the usual homogenized models, as well as a different model formulation. This does not only require exascale or larger supercomputers but also a joint effort of biomedical engineers, mathematicians, and computer scientists to build a platform that runs effectively on these machines.

The EuroHPC project MICROCARD and its follow-up MICROCARD2 (2024–2027, 30M) are building such a platform, a true digital twin of the cardiac muscle at the micrometer scale in line with the vision of the European Commission’s Virtual Human Twin Initiative. Our lighthouse application will be called BCARP. It is a branch of the openCARP code that is dedicated to exascale cell-by-cell simulations. Where possible, our developments will be merged back as improvements to openCARP.

Objectives

Powerful time- and energy-efficient solvers preconditioners for large systems of linear equations are crucial for the exploitation of upcoming exascale and post-exascale computing resources. MICROCARD2 leverages a multidisciplinary collaboration between applied mathematicians and HPC scientists to deliver algorithms and codes that are tailored to these scales, the particularities of our lighthouse exascale application and those of heterogeneous accelerator-based architectures, striving for high performance and energy efficiency. For example, space and time steps for integration of the membrane models can be increased when no activation wavefront is nearby. Previous work has shown that it is hard to use this adaptivity to improve performance on a parallel computer, due to the overhead of work redistribution. However, increased step size can still be used to improve energy efficiency. This will be handled in the integration methods for membrane models and in the linear system solvers and preconditioners. In the membrane models, also individual slowly-changing variables.

Energy efficiency will also be handled by the runtime system at the node level. On heterogeneous architectures, choosing the right computing unit to perform each computation can reduce energy consumption. Depending on the task’s characteristics, allowing a small performance degradation can lead to large energy savings. Also data movement has an important effect on both performance and energy consumption. This cost should be considered when placement of computations implies data
movement. Powercapping may also help to reduce energy usage. In some cases using more nodes while enforcing a powercap provides better performance than using fewer nodes at their maximum limit. The power budget for each task must therefore be determined. In order to dynamically set the powercap, we will benefit from the performance models already provided by the StarPU task-based runtime system developed by Inria team STORM, and augment them with powercap impact, after studying the impact of power capping on the performance models.

**Mission confiée**

Load imbalance as incurred by imperfect mesh partitioning, algebraic adaptivity, direct solver fill-in, or solution-dependent solver iteration count can be exploited to reduce power consumption and energy use. The first part of the mission will be to derive rough predictions of the computational work to be done on each device up to the next synchronization barrier, and then to implement throttling techniques such as enforcing a lower frequency scaling (when available), a lower parallelism degree, or the selection of kernel variants with lower energy consumption profiles.

The technical details of hardware computing platforms at supercomputing centers vary significantly due to their use of different combinations of technical solutions, vendors and generations. The second part of the mission, will be the adaptation of the computing kernels to the target hardware platform. This part of the work will therefore focus on porting the hardware-dependent part of the project’s code generation and runtime systems onto the targeted computing platforms to ensure the application can access the full extent of the available computing resources – such as the CPU SIMD instruction sets and accelerator devices – and can access the monitoring and control services – such as the energy consumption metrics reporting and the power capping controls – in an abstract and portable manner, when available. In parallel, this second part of the work will leverage task scheduling, kernel performance modeling and variant selection, and optionally worker thread frequency scaling techniques if available to unprivileged users on the target platforms, to optimize the energy consumption level and enforce selected power capping profiles at the compute node level. The aim is to obtain an efficient trade-off between the potentially conflicting goals of obtaining short response times and minimal environmental impact.

**Principales activités**

Main activities (5 maximum):

- Implement energy consumption modeling and throttling techniques to actively manage the application energy consumption at the task-based runtime system level.
- Implement hardware adaptation techniques to tailor the application kernels and the runtime system layer to the target hardware platform.
- Ensure the continuous integration and the quality control of software developments.
- Conduct validation and performance evaluation experiments.
- Participate to software documentation, timely deliverable preparation and reporting, and dissemination & transfer efforts within the project and the community

**Compétences**

Fluent skills are required in the following activities:

- C / C++ programming
- Software development in the Unix environment
- Parallel and distributed programming
- Remote development and operating using ssh
- Development using a version control system such as Git
- Continuous integration using a system such as GitLab-CI

Good technical and scientific skills in both written and oral English are necessary to successfully conduct the mission, interact with the project partners and prepare reporting documents.

**Avantages**

- Subsidized meals
- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Social security coverage

**Rémunération**
The gross monthly salary will be between 2692€ and 3404€, depending on your qualifications and professional experience (before social security contributions and monthly withholding tax).

**Informations générales**

- **Thème/Domaine**: Calcul distribué et à haute performance  
  Calcul Scientifique (BAP E)
- **Ville**: Talence
- **Centre Inria**: Centre Inria de l'université de Bordeaux
- **Date de prise de fonction souhaitée**: 2024-10-01
- **Durée de contrat**: 2 ans
- **Date limite pour postuler**: 2024-08-31

**Contacts**

- **Équipe Inria**: STORM  
- **Recruteur**: Aumage Olivier / Olivier.Aumage@inria.fr

**A propos d'Inria**

Inria est l'institut national de recherche dédié aux sciences et technologies du numérique. Il emploie 2600 personnes. Ses 215 équipes-projets agiles, en général communes avec des partenaires académiques, impliquent plus de 3900 scientifiques pour relever les défis du numérique, souvent à l'interface d'autres disciplines. L'institut fait appel à de nombreux talents dans plus d'une quarantaine de métiers différents. 900 personnels d'appui à la recherche et à l'innovation contribuent à faire émerger et grandir des projets scientifiques ou entrepreneuriaux qui impactent le monde. Inria travaille avec de nombreuses entreprises et a accompagné la création de plus de 200 start-up. L'institut s'efforce ainsi de répondre aux enjeux de la transformation numérique de la science, de la société et de l'économie.

**L'essentiel pour réussir**

The key to success in realizing this mission is the ability of the candidate at international, multi-disciplinary team-work. MICROCARD2 involves 10 partner institutions from 4 European countries with people from academics and industrial entities, including cardiac physiology specialists, applied mathematics specialists and high performance computing specialists. It is therefore essential to be able to adapt to this level of diversity and to constructively interact with people of significantly different backgrounds.

| Attention: Les candidatures doivent être déposées en ligne sur le site Inria. Le traitement des candidatures adressées par d'autres canaux n'est pas garanti. |

**Consignes pour postuler**

If you are interested by this job, please could you apply on website jobs.inra with the following documents:

- cv
- cover letter

**Sécurité défense**:

Ce poste est susceptible d'être affecté dans une zone à régime restrictif (ZRR), telle que définie dans le décret n°2011-1425 relatif à la protection du potentiel scientifique et technique de la nation (PPST). L'autorisation d'accès à une zone est délivrée par le chef d'établissement, après avis ministériel favorable, tel que défini dans l'arrêté du 03 juillet 2012, relatif à la PPST. Un avis ministériel défavorable pour un poste affecté dans une ZRR aurait pour conséquence l'annulation du recrutement.

**Politique de recrutement**:

Dans le cadre de sa politique diversité, tous les postes Inria sont accessibles aux personnes en situation de handicap.
